The Case Against Intellectual Property

Stephan Kinsella

Abstract

The purpose of property rights is to allocate owners of scarce resources to permit peaceful, cooperative, productive use of these resources. For external, non-bodily resources, this allocation is done in accordance with the libertarian-Lockean first-use/first-own homesteading principle. So-called intellectual property rights such as patent and copyright are monopoly privileges granted by the state that dilute and undermine property rights in scarce resources. This chapter explores the nature of property rights and argues that intellectual property is incompatible with genuine private property rights. The chapter also criticizes utilitarian arguments in favor of intellectual property as being fallacious in terms of ethics, methodology, and economics.

Introduction

All libertarians favor property rights, and agree that property rights include rights in physical, material (sometimes referred to as “tangible”) resources. These resources include immovables (realty) such as land and houses, and movables such as chairs, clubs, cars, and clocks.1

This chapter is based on “Against Intellectual Property,” first published in the Journal of Libertarian Studies 15, no. 2 (Spring 2001). See also my article The Case Against IP: A Concise Guide, MISES DAILY (Sep. 4, 2009), my blog post “Selected Supplementary Material for Against Intellectual Property,” C4SIF Blog (Mar. 1, 2012), c4sif.org, and resources available at http://c4sif.org/resources/. Further, all libertarians support rights in one’s own body. Such rights may be called “self-ownership” as long as one keeps in mind that there is dispute about whether such body-ownership is alienable in the same way that rights in homesteadable, external objects are alienable. In any event, libertarians universally hold that all material scarce resources – whether homesteadable or created, immovable or movable, or our very bodies – are subject to rightful control, or “ownership,” by specified individuals.  

As we move away from the material (or corporeal) toward the immaterial (incorporeal), matters become fuzzier. Rights to reputations (defamation laws) and against blackmail, for example, are rights in very immaterial types of things. Most, though not all, libertarians oppose laws against blackmail, and many oppose the idea of a right to one’s reputation.  

Also disputed is the concept of intellectual property (herein referred to as IP). Are there individual rights to one’s intellectual creations, such as inventions or written works? Should the legal system protect such rights? Below, I summarize current US law on intellectual property rights. I then survey various libertarian views on IP rights, and present what I consider to be the proper view.

### Summary of IP Law

#### Types of IP

Intellectual property is a broad concept that covers several types of legally recognized rights arising from some type of intellectual creativity, or that are otherwise related to ideas. IP rights are rights to immaterial things – to ideas, as expressed (copyrights), or as embodied in a practical implementation (patents). Tom Palmer puts it this way: “Intellectual property rights are rights in ideal objects, which are distinguished from the material substrata in which they are instantiated.” In today’s legal systems, IP typically includes at least copyrights, trademarks, patents, and trade secrets.

#### Copyright

Copyright is a right given to authors of “original works,” such as books, articles, movies, and computer programs. Copyright gives the exclusive right to reproduce the work, prepare derivative works, or to perform or present the work publicly (17 USC §§ 101, 106 et pass). Copyrights protect only the form or expression of ideas, not the underlying ideas themselves.  

While a copyright may be registered to obtain legal advantages, a copyright need not be registered to exist. Rather, a copyright comes into existence automatically the moment the work is “fixed” in a “tangible medium of expression,” and lasts for the life of the author plus 70 years, or for a total of 95 years in cases in which the employer owns the copyright.
Patent

A patent is a property right in inventions, i.e., in devices or processes that perform a “useful” function (35 USC § 1 et seq.; 37 CFR Part 1). A new or improved mousetrap is an example of a type of device which may be patented. A patent effectively grants the inventor a limited monopoly on the manufacture, use, or sale of the invention. However, a patent actually only grants to the patentee the right to exclude (i.e., to prevent others from practicing the patented invention); it does not actually grant to the patentee the right to use the patented invention.\(^{10}\)

Not every innovation or discovery is patentable. The US Supreme Court has, for example, identified three categories of subject matter that are unpatentable, namely “laws of nature, natural phenomena, and abstract ideas” (Diamond v Diehr, 450 US 175, 185 (1981); see also 35 USC § 101). Reducing abstract ideas to some type of “practical application,” i.e., “a useful, concrete, and tangible result,” \(^{11}\) is patentable, however. US patents, since June 8, 1995, last from the date of issuance until 20 years from the original filing date of the patent application (35 USC § 154(a)(2)) (the previous term was 17 years from date of issue).

Trade Secret

A trade secret consists of any confidential formula, device, or piece of information which gives its holder a competitive advantage so long as it remains secret.\(^{12}\) An example would be the formula for Coca-Cola®. Trade secrets can include information that is not novel enough to be subject to patent protection, or not original enough to be protected by copyright (e.g., a database of seismic data or customer lists). Trade secret laws are used to prevent “misappropriations” of the trade secret, or to award damages for such misappropriations (See the Uniform Trade Secrets Act [UTSA]). Trade secrets are protected under state law, although recent federal law has been enacted to prevent theft of trade secrets (Economic Espionage Act of 1996, 18 USC §§ 1831–39).

Trade secret protection is obtained by declaring that the details of a subject are secret. The trade secret theoretically may last indefinitely, although disclosure, reverse-engineering, or independent invention may destroy it. Trade secrets can protect secret information and processes, for example, compilations of data and maps not protectable by copyright, and can also be used to protect software source code not disclosed and not otherwise protectable by patent. One disadvantage of relying on trade secret protection is that a competitor who independently invents the subject of another’s trade secret can obtain a patent on the device or process and actually prevent the original inventor (the trade secret holder) from using the invention.

Trademark

A trademark is a word, phrase, symbol, or design used to identify the source of goods or services sold, and to distinguish them from the goods or services of others.
For example, the Coca-Cola® mark and the design that appears on their soft drink cans identifies them as products of that company, distinguishing them from competitors such as Pepsi®. Trademark law primarily prevents competitors from “infringing” upon the trademark, i.e., using “confusingly similar” marks to identify their own goods and services. Unlike copyrights and patents, trademark rights can last indefinitely if the owner continues to use the mark. The term of a federal trademark registration lasts 10 years, with 10-year renewal terms being available (15 USC § 1501 et seq.; 37 CFR Part 2).

Other rights related to trademark protection include rights against trademark dilution (15 USC §§ 1125(c), 1127), certain forms of cybersquatting (15 USC § 1125(d); Anticybersquatting Consumer Protection Act, PL 106–113 (1999); HR 3194, S1948), and various “unfair competition” claims. IP also includes recent legal innovations, such as the mask work protection available for semiconductor integrated circuit (IC) designs (See 17 USC § 901 et seq), the sui generis protection, similar to copyright, for boat hull designs (See 17 USC § 1301 et seq), and the proposed sui generis right in databases, or collections of information.13

In the United States, federal law almost exclusively governs copyrights and patents, since the Constitution grants Congress the power “to promote the progress of science and useful arts.”14 Despite the federal source of patents and copyrights, various related aspects, such as ownership of patents, are based on state law, which nevertheless tend to be fairly uniform from state to state (See [28], and Chisum on Patents, § 22.03; 17 USC §§ 101, 201). Federal trademarks, by contrast, not being explicitly authorized in the Constitution, are based on the interstate commerce clause and thus only cover marks for goods and services in interstate commerce.15 State trademarks still exist since they have not been completely preempted by federal law, but federal marks tend to be more commercially important and powerful. Trade secrets are generally protected under state, not federal, law.16

Many laymen, including libertarians, have a poor understanding of IP concepts and law, and often confuse copyrights, trademarks, and patents. It is widely, and incorrectly, believed that in the US system, the inventor who files first at the patent office has priority over those who file later. However, until last year, the US system actually had a “first-to-invent” system, unlike most other countries, which have traditionally had a “first-to-file” system for priority.17 (The America Invents Act, enacted in late 2011, changed the US system to a first-to-file system similar to that of other countries.)18

**IP Rights and Relation to Material Property**

As noted above, IP rights, at least for patents and copyrights, may be considered rights in ideal objects. It is important to point out that ownership of an idea, or ideal object, effectively gives the IP owners a property right in every physical embodiment of that work or invention. Consider a copyrighted book. Copyright holder A has a right to the underlying ideal object, of which the book is but one example. The copyright system gives A the right in the very pattern of words in the book; therefore,
by implication, A has a right to every tangible or material instantiation or embodiment of the book – i.e., a right in every physical version of the book, or, at least, to every book within the jurisdiction of the legal system that recognizes the copyright.

Thus, if A writes a novel, he has a copyright in this “work.” If he sells a physical copy of the novel to B, in book form, then B owns only that one physical copy of the novel; B does not own the “novel” itself, and is not entitled to make a copy of the novel, even using his own paper and ink. Thus, even if B owns the material property of paper and printing press, he cannot use his own property to create another copy of A’s book. Only A has the right to copy the book (hence, “copyright”).

Likewise, A’s ownership of a patent gives him the right to prevent a third party from using or practicing the patented invention, even if the third party only uses his own property. In this way, A’s ownership of ideal rights gives him some degree of control – ownership – over the material property of innumerable others. Patent and copyright invariably transfer partial ownership of material property from its natural owner to innovators, inventors, and artists. As I have argued elsewhere [32], patent and copyright grant a negative servitude in the property of others to the IP holder.

Libertarian Perspectives on IP

The Spectrum

Libertarian views on IP range from complete support of the fullest gamut of IP imaginable, to outright opposition to IP rights. Most of the debate about IP concerns patent and copyright; as discussed below, trademark and trade secret are less problematic. Therefore, this chapter focuses primarily on the legitimacy of patent and copyright.

Pro-IP arguments may be divided into natural-rights and utilitarian arguments. Libertarian IP advocates tend to adopt the former justification.19 For example, natural-rights, or at least not explicitly utilitarian, libertarian proponents of IP include, from more to less extreme, Galambos, Schulman, and Rand.20 Among precursors to modern libertarians, Spooner and Spencer both advocated IP on moral or natural-rights grounds.21

According to the natural-rights view of IP held by some libertarians, creations of the mind are entitled to protection just as material property is. Both are the product of one’s labor and one’s mind. Because one owns one’s labor, one has a natural law right to the fruit of one’s labor. Under this view, just as one has a right to the crops one plants, so one has a right to the ideas one generates and the art one produces ([50], p. 819).

This theory depends on the notion that one owns one’s body and labor, and therefore, its fruits, including intellectual “creations.” An individual creates a sonnet, a song, a sculpture, by employing his own labor and body. He is thus entitled to “own” these creations, because they result from other things he “owns.”
There are also utilitarian pro-IP arguments. Federal Judge Richard Posner is one prominent utilitarian (although not libertarian) IP advocate [51]. Among libertarians, anarchist David Friedman analyzes and appears to endorse IP on “law-and-economics” grounds,22 a utilitarian institutional framework. The utilitarian argument presupposes that we should choose laws and policies that maximize “wealth” or “utility.” With respect to copyright and patent, the idea is that more artistic and inventive “innovation” corresponds with, or leads to, more wealth. Public goods and free-rider effects reduce the amount of such wealth below its optimal level, i.e., lower than the level we would achieve if there were adequate IP laws on the books. Thus, wealth is optimized, or at least increased, by granting copyright and patent monopolies that encourage authors and inventors to innovate and create.23

On the other hand, there is a long tradition of opposition to patent and copyright. Modern opponents include Rothbard, McElroy, Palmer, Lepage, Bouckaert, and myself.24 Benjamin Tucker also vigorously opposed IP in a debate in the nineteenth century individualist-anarchist periodical *Liberty.*25 These commentators point out the many problems with conventional utilitarian and natural-rights arguments given to justify IP rights. These and other shortcomings of standard pro-IP arguments are surveyed below.

### Utilitarian Defenses of IP

Advocates of IP often justify it on utilitarian grounds. Utilitarians hold that the “end” of encouraging more innovation and creativity justifies the seemingly immoral “means” of restricting the freedom of individuals to use their physical property as they see fit. But there are three fundamental problems with justifying any right or law on strictly utilitarian grounds.

First, let us suppose that wealth or utility could be maximized by adopting certain legal rules; the “size of the pie” is increased. Even then, this does not show that these rules are justified. For example, one could argue that net utility is enhanced by redistributing half of the wealth of society’s richest 1% to its poorest 10%. But even if stealing some of A’s property and giving it to B increases B’s welfare “more” than it diminishes A’s (if such a comparison could, somehow, be made), this does not establish that the theft of A’s property is justified. Wealth maximization is not the goal of law; rather, the goal is justice – giving each man his due.26 Even if overall wealth is increased due to IP laws, it does not follow that this allegedly desirable result justifies the unethical violation of some individuals’ rights to use their own property as they see fit.

In addition to ethical problems, utilitarianism is not coherent. It necessarily involves making illegitimate interpersonal utility comparisons, as when the “costs” of IP laws are subtracted from the “benefits” to determine whether such laws are a net benefit.27 But not all values have a market price; in fact, none of them do. Mises showed that even for goods that have a market price, the price does not serve as a *measure* of the good’s value.28

Finally, even if we set aside the problems of interpersonal utility comparisons and the justice of redistribution and we plow ahead, employing standard utilitarian
measurement techniques, it is not at all clear that IP laws lead to any change – either an increase or a decrease – in overall wealth.\textsuperscript{29} It is debatable whether copyrights and patents really are necessary to encourage the production of creative works and inventions, or that the incremental gains in innovation outweigh the immense costs of an IP system. Econometric studies do not conclusively show net gains in wealth. Perhaps there would even be more innovation if there were no patent laws; maybe more money for research and development (R&D) would be available if it were not being spent on patents and lawsuits. It is possible that companies would have an even greater incentive to innovate if they could not rely on a near 20-year monopoly (see [57, 86, 87], for further examples of costs of patent and copyright laws).

There are undoubtedly costs of the patent system. As noted, patents can be obtained only for “practical” applications of ideas, but not for more abstract or theoretical ideas. This skews resources away from theoretical R&D.\textsuperscript{30} It is not clear that society is better off with relatively more practical invention and relatively less theoretical research and development. Additionally, many inventions are patented for defensive reasons, resulting in patent lawyers’ salaries and patent office fees. This large overhead would be unnecessary if there were no patents. In the absence of patent laws, for example, companies would not spend money obtaining or defending against ridiculous patents. It simply has not been shown that IP leads to net gains in wealth. But should not those who advocate the use of force against others’ property have to satisfy a burden of proof?

We must remember that when we advocate certain rights and laws, and inquire into their legitimacy, we are inquiring into the legitimacy and ethics of the use of force. To ask whether a law should be enacted or exist is to ask: Is it proper to use force against certain people in certain circumstances? It is no wonder that this question is not really addressed by analysis of wealth maximization. Utilitarian analysis is thoroughly confused and bankrupt: Talk about increasing the size of the pie is methodologically flawed; there is no clear evidence that the pie increases with IP rights. Further, pie growth does not justify the use of force against the otherwise legitimate property of others. For these reasons, utilitarian IP defenses are unpersuasive.

**Some Problems with Natural Rights**

Other libertarian proponents of IP argue that certain ideas deserve protection as property rights because they are created. Rand supported patents and copyrights as “the legal implementation of the base of all property rights: a man’s right to the product of his mind” ([29], p. 130). For Rand, IP rights are, in a sense, the reward for productive work. It is only fair that a creator reap the benefits of others using his creation. For this reason, in part, she opposes perpetual patent and copyright – because future, unborn heirs of the original creator are not themselves responsible for the creation of their ancestors’ work.

One problem with the creation-based approach is that it almost invariably protects only *certain types* of creations – unless, i.e., every single useful idea one
comes up with is subject to ownership (more on this below). But the distinction between the protectable and the unprotectable is necessarily arbitrary. For example, philosophical or mathematical or scientific truths cannot be protected under current law on the grounds that commerce and social intercourse would grind to a halt were every new phrase, philosophical truth, and the like considered the exclusive property of its creator. For this reason, patents can be obtained only for so-called practical applications of ideas, but not for more abstract or theoretical ideas. Rand agrees with this disparate treatment, in attempting to distinguish between an unpatentable *discovery* and a patentable *invention*. She argues that a “scientific or philosophical discovery, which identifies a law of nature, a principle, or a fact of reality not previously known” is not *created* by the discoverer.

But the distinction between creation and discovery is not clear-cut or rigorous. Nor is it clear why such a distinction, even if clear, is ethically relevant in defining property rights. No one creates *matter*; they just manipulate and grapple with it according to physical laws. In this sense, no one really creates *anything*. They merely rearrange matter into new arrangements and patterns. An engineer who invents a new mousetrap has rearranged existing parts to provide a function not previously performed [90]. Others who learn of this new arrangement can now also make an improved mousetrap. Yet the mousetrap merely follows laws of nature. The inventor did not invent the matter out of which the mousetrap is made, nor the *facts* and laws exploited to make it work.

Similarly, Einstein’s “discovery” of the relation $E = mc^2$, once known by others, allows them to manipulate matter in a more efficient way. Without Einstein’s, or the inventor’s, efforts, others would have been ignorant of certain causal laws, of ways matter can be manipulated and utilized. Both the inventor and the theoretical scientist engage in creative mental effort to produce useful, new ideas. Yet one is rewarded, and the other is not. In one recent case, the inventor of a new way to calculate a number representing the shortest path between two points—an extremely useful technique—was not given patent protection because this was “merely” a mathematical algorithm. But it is arbitrary and unfair to reward more practical inventors and entertainment providers, such as the engineer and songwriter, and to leave more theoretical science and math researchers and philosophers unrewarded. The distinction is inherently vague, arbitrary, and unjust.

Moreover, adopting a limited term for IP rights, as opposed to a perpetual right, also requires arbitrary rules. For example, patents last for 20 years from the filing date, while copyrights last, in the case of individual authors, for 70 years past the author’s death. No one can seriously maintain that 19 years for a patent is too short, and 21 years too long, any more than the current price for a gallon of milk can be objectively classified as too low or too high.

Thus, one problem with the natural-rights approach to validating IP is that it necessarily involves arbitrary distinctions with respect to what classes of creations deserve protection, and concerning the length of the term of the protection.

Of course, one way to avoid this difficulty is to claim that *everything* is protectable by IP, with perpetual (infinite) terms. Spooner [47, 50, 60], for example, advocated perpetual rights for patent and copyright. Schulman advocates a much
broader concept of creations or ideas protectable by IP. He argues for property rights called “logorights” in any “logos” that one creates. The logos is the “material identity” or identity-pattern of created things. The owner of a logos would own the order or pattern of information imposed upon, or observed in, material substances.

The most radical of all IP proponents is Andrew Joseph Galambos, whose ideas, to the extent that I understand them, border on the absurd. Galambos believed that man has property rights in his own life (primordial property) and in all “non-procreative derivatives of his life” [45, 46]. Since the “first derivatives” of a man’s life are his thoughts and ideas, thoughts and ideas are “primary property.” Since action is based on primary property (ideas), actions are owned as well; this is referred to as “liberty.” Secondary derivatives, such as land, televisions, and other material goods, are produced by ideas and action. Thus, property rights in material items are relegated to lowly secondary status, as compared with the “primary” status of property rights in ideas. (Even Rand once elevated patents over mere property rights in material goods, in her bizarre notion that “patents are the heart and core of property rights” ([29], p. 133). Can we really believe that there were no property rights respected before the 1800s, when patent rights became systematized?)

Galambos reportedly took his own ideas to ridiculous lengths, claiming a property right in his own ideas and requiring his students not to repeat them [45], dropping a nickel in a fund box every time he used the word “liberty,” as a royalty to the descendants of Thomas Paine, the alleged “inventor” of the word “liberty”; and changing his original name from Joseph Andrew Galambos (Jr., presumably) to Andrew Joseph Galambos, to avoid infringing his identically named father’s rights to the name.34

By widening the scope of IP, and by lengthening its duration to avoid making such arbitrary distinctions as Rand does, the absurdity and injustice caused by IP becomes even more pronounced (as Galambos demonstrates). And by extending the term of patents and copyrights to infinity, subsequent generations would be choked by ever-growing restraints on their own use of property. No one would be able to manufacture – or even use – a light bulb without getting permission from Edison’s heirs. No one would even be able to build a house without getting permission from the heirs of the first protohuman who left the caves and built a hut. No one could use a variety of life-saving techniques, chemicals, or treatments without obtaining permission of various lucky, rich descendants. No one would be able to boil water to purify it, or use pickling to preserve foods, unless he is granted license by the originators (or their distant heirs) of such techniques.

Such unbounded ideal rights would pose a serious threat to material-property rights, and would threaten to overwhelm them. All use of material property would by now be impossible, as every conceivable use of property, every single action, would be bound to infringe upon one of the millions of past, accreted IP rights, and the human race would die of starvation. But, as Rand noted, men are not ghosts; we have a spiritual aspect, but also a physical one ([91], pp. 326–27, 467). Any system that elevates rights in ideas to such an extreme that it overrides rights in material things is clearly not a suitable ethical system for living, breathing human beings.
No one living can actually act in accordance with such an unrestricted view of IP. The remaining advocates of IP all qualify their endorsement by limiting the scope and/or terms of IP rights, thus adopting the ethically arbitrary distinctions noted above.

A deeper problem for the natural-rights position lies in its undue emphasis on “creation,” instead of scarcity, as giving rise to property rights, as discussed below.

IP and Property Rights

Property and Scarcity

Let us take a step back and look afresh at the idea of property rights. Libertarians believe in property rights in material goods (resources). Why? What is it about material goods that makes them subjects for property rights? Why are material goods property?

A little reflection will show that it is these goods’ scarcity – the fact that there can be conflict over these goods by multiple human actors. The very possibility of conflict over a resource renders it scarce, giving rise to the need for ethical rules to govern its use. Thus, the fundamental social and ethical function of property rights is to prevent interpersonal conflict over scarce resources.\(^{35}\) As Hoppe notes:

\[\text{[O]nly because scarcity exists is there even a problem of formulating moral laws; insofar as goods are superabundant (“free” goods), no conflict over the use of goods is possible and no action-coordination is needed. Hence, it follows that any ethic, correctly conceived, must be formulated as a theory of property, i.e., a theory of the assignment of rights of exclusive control over scarce resources (\cite{[93]}, p. 235 n. 9).}\]

Others who recognize the importance of scarcity in defining what property is include Plant, Hume, Palmer, Rothbard, and Tucker.\(^{36}\)

Nature, then, contains things that are economically scarce. My use of such a thing conflicts with (excludes) your use of it, and vice versa. The function of property rights is to prevent interpersonal conflict over scarce resources, by allocating exclusive ownership of resources to specified individuals (owners). To perform this function, property rights must be both visible and just. Clearly, in order for individuals to avoid using property owned by others, property borders and property rights must be objective (intersubjectively ascertainable); they must be visible.\(^{37}\) For this reason, property rights must be objective and unambiguous. In other words, “good fences make good neighbors.”

Property rights must be demonstrably just, as well as visible, because they cannot serve their function of preventing conflict unless they are acceptable as fair by those affected by the rules (\cite{[93]}, p. 138). If property rights are allocated unfairly, or simply grabbed by force, this is like having no property rights at all; it is merely might versus right again, i.e., the pre-property rights situation. But as libertarians recognize, following Locke, it is only the first occupier or user of
such property that can be its natural owner. Only the *first-occupier* homesteading rule provides an objective, ethical, and nonarbitrary allocation of ownership in scarce resources.\(^3\) When property rights in scarce means are allocated in accordance with first-occupier homesteading rules, property borders are visible, and the allocation is demonstrably just. Conflict can be avoided with such property rights in place because third parties can see and, thus, sidestep the property borders, and be motivated to do so because the allocation is just and fair.

But surely it is clear, given the origin, justification, and function of property rights, that they are applicable only to *scarce* resources. Were we in a Garden of Eden where land and other goods were infinitely abundant, there would be no scarcity and, therefore, no need for property rules; property concepts would be meaningless. The idea of conflict, and the idea of rights, would not even arise. For example, your taking my lawnmower would not really deprive me of it if I could conjure up another in the blink of an eye. Lawnmower-taking in these circumstances would not be “theft.” Property rights are not applicable to things of infinite abundance, because there cannot be conflict over such things.

Thus, property rights must have objective, discernible borders, and must be allocated in accordance with the first-occupier homesteading rule. Moreover, property rights can apply only to scarce resources. The problem with IP rights is that the ideal objects protected by IP rights are not scarce; and, further, that such property rights are not, and cannot be, allocated in accordance with the first-occupier homesteading rule, as will be seen below.

**Scarcity and Ideas**

Like the magically reproducible lawnmower, ideas are not scarce. If I invent a technique for harvesting cotton, your harvesting cotton in this way would not take away the technique from me. I still have my technique (as well as my cotton). Your use does not exclude my use; we could both use my technique to harvest cotton. There is no economic scarcity, and no possibility of conflict over the use of a scarce resource. Thus, there is no need for exclusivity.

Similarly, if you copy a book I have written, I still have the original (material) book, and I also still “have” the pattern of words that constitute the book. Thus, authored works are not scarce in the same sense that a piece of land or a car is scarce. If you take my car, I no longer have it. But if you “take” a book-pattern and use it to make your own physical book, I still have my own copy. The same holds true for inventions and, indeed, for any “pattern” or information one generates or has. As Thomas Jefferson – himself an inventor, as well as the first Patent Examiner in the USA – wrote, “He who receives an idea from me, receives instruction himself without lessening mine; as he who lights his taper at mine, receives light without darkening me.”\(^3\) Since use of another’s idea does not deprive him of its use, no conflict over its use is possible; ideas, therefore, are not candidates for property rights. Even Rand acknowledged that “intellectual property cannot be consumed.”\(^4\)
Ideas are not naturally scarce. However, by recognizing a right in an ideal object, one creates scarcity where none existed before. As Arnold Plant explains:

It is a peculiarity of property rights in patents (and copyrights) that they do not arise out of the scarcity of the objects which become appropriated. They are not a consequence of scarcity. They are the deliberate creation of statute law, and, whereas in general the institution of private property makes for the preservation of scarce goods, tending . . . to lead us “to make the most of them,” property rights in patents and copyrights make possible the creation of a scarcity of the products appropriated which could not otherwise be maintained.41

Bouckaert also argues that natural scarcity is what gives rise to the need for property rules, and that IP laws create an artificial, unjustifiable scarcity. As he notes:

Natural scarcity is that which follows from the relationship between man and nature. Scarcity is natural when it is possible to conceive of it before any human, institutional, contractual arrangement. Artificial scarcity, on the other hand, is the outcome of such arrangements. Artificial scarcity can hardly serve as a justification for the legal framework that causes that scarcity. Such an argument would be completely circular. On the contrary, artificial scarcity itself needs a justification ([63], p. 793; see also pp. 797–99).

Thus, Bouckaert maintains that “only naturally scarce entities over which physical control is possible are candidates for” protection by real property rights ([63], pp. 799, 803). For ideal objects, the only protection possible is that achievable through personal rights, i.e., contract (more on this below).42

Only material, scarce resources are the possible object of interpersonal conflict, so it is only for them that property rules are applicable. Thus, patents and copyrights are unjustifiable monopolies granted by government legislation. It is not surprising that, as Palmer notes, “[m]onopoly privilege and censorship lie at the historical root of patent and copyright” ([61], p. 264). It is this monopoly privilege that creates an artificial scarcity where there was none before.

Let us recall that IP rights give to pattern-creators partial rights of control — ownership — over the material property of everyone else. The pattern-creator has partial ownership of others’ property, by virtue of his IP right, because he can prohibit them from performing certain actions with their own property. Author X, for example, can prohibit a third party, Y, from inscribing a certain pattern of words on Y’s own blank pages with Y’s own ink.

That is, by merely authoring an original expression of ideas, by merely thinking of and recording some original pattern of information, or by finding a new way to use his own property (recipe), the IP creator instantly, magically becomes a partial owner of others’ property. He has some say over how third parties can use their property. He is granted, in effect, a type of “negative servitude” in others’ already-owned property” (See [32]). IP rights change the status quo by redistributing property from individuals of one class (material-property owners) to individuals of another (authors and inventors). Prima facie, therefore, IP law trespasses against or “takes” the property of material-property owners, by transferring partial ownership to authors and inventors. It is this invasion and redistribution of property that must be justified in order for IP rights to be valid. We see, then, that utilitarian defenses do not do the trick. Further problems with natural-rights defenses are explored below.
Creation Versus Scarcity

Some inconsistencies and problems with natural-rights theories of IP were pointed out above. This section discusses further problems with such arguments, in light of the preceding discussion of the significance of scarcity.

As noted before, some libertarian IP advocates, such as Rand, hold that creation is the source of property rights (See [29, 39, 42, 43]). This confuses the nature and reasons for property rights, which lie in the undeniable fact of scarcity. Given scarcity and the correspondent possibility of conflict in the use of resources, conflicts are avoided and peace and cooperation are achieved by allocating property rights to such resources. And the purpose of property rights dictates the nature of such rules. For if the rules allocating property rights are to serve as objective rules that all can agree upon so as to avoid conflict, they cannot be biased or arbitrary (See [93], Chap. 7, esp. p. 138). For this reason, unowned resources come to be owned – homesteaded or appropriated – by the first possessor ([93], p. 142; [76], pp. 172–79; and [97], p. 105).

The general rule, then, is that ownership of a given scarce resource can be identified by determining who first occupied it. There are various ways to possess or occupy resources, and different ways to demonstrate or prove such occupation, depending upon the nature of the resource and the use to which it is put. Thus, I can pluck an apple from the wild and thereby homestead it, or I can fence in a plot of land for a farm. It is sometimes said that one form of occupation is “forming” or “creating” the thing. For example, I can sculpt a statue from a block of marble, or forge a sword from raw metal, or even “create” a farm on a plot of land.

We can see from these examples that creation is relevant to the question of ownership of a given “created” scarce resource, such as a statue, sword, or farm, only to the extent that the act of creation is an act of occupation, or is otherwise evidence of first occupation. However, “creation” itself does not justify ownership in things; it is neither necessary nor sufficient. One cannot create some possibly disputed scarce resource without first using the raw materials used to create the item. But these raw materials are scarce, and either I own them or I do not. If not, then I do not own the resulting product. If I own the inputs, then, by virtue of such ownership, I own the resulting thing into which I transform them.

Consider the forging of a sword. If I own some raw metal (because I mined it from ground I owned), then I own the same metal after I have shaped it into a sword. I do not need to rely on the fact of creation to own the sword, but only on my ownership of the factors used to make the sword. And I do not need creation to come to own the factors, since I can homestead them by simply mining them from the ground and thereby becoming the first possessor. On the other hand, if I fashion a sword using your metal, I do not own the resulting sword. In fact, I may owe you damages for trespass or conversion.

Creation, therefore, is neither necessary nor sufficient to establish ownership. The focus on creation distracts from the crucial role of first occupation as a property
rule for addressing the fundamental fact of scarcity. First occupation, not creation or labor, is both necessary and sufficient for the homesteading of unowned scarce resources.

One reason for the undue stress placed on creation as the source of property rights may be the focus by some on *labor* as the means to homestead unowned resources. This is manifest in the argument that one homesteads unowned property with which one mixes one’s labor *because* one “owns” one’s labor. However, as Palmer correctly points out, “occupancy, not labor, is the act by which external things become property.” By focusing on first occupancy, rather than on labor, as the key to homesteading, there is no need to place creation as the fount of property rights, as Objectivists and others do. Instead, property rights must be recognized in first-comers (or their contractual transferees) in order to avoid the omnipresent problem of conflict over scarce resources. Creation itself is neither necessary nor sufficient to gain rights in unowned resources. Further, there is no need to maintain the strange view that one “owns” one’s labor in order to own things one first occupies. Labor is a type of action, and action is not ownable; rather, it is the way that some material things (e.g., bodies) act in the world.

The problem with the natural-rights defense of IP, then, lies in the argument that because an author-inventor “creates” some “thing,” he is “thus” entitled to own it. The argument begs the question by assuming that the ideal object is ownable in the first place; once this is granted, it seems natural that the “creator” of this piece of property is the natural and proper owner of it. However, ideal objects are not ownable.

Under the libertarian approach, *when* there is a scarce (ownable) resource, we identify its owner by determining who its first occupier is. In the case of “created” goods (i.e., sculptures, farms, etc.), it can sometimes be assumed that the creator is also the first occupier by virtue of the gathering of raw materials and the very act of creation (imposing a pattern on the matter, fashioning it into an artifact, and the like). But it is not creation per se that gives rise to ownership, as pointed out above. For similar reasons, the Lockean idea of “mixing labor” with a scarce resource is relevant only because it *indicates* that the user has possessed the property (for property must be *possessed* in order to be labored upon). It is not because the labor must be rewarded, nor because we “own” labor and “therefore” its fruits. In other words, creation and labor-mixing *indicate* when one has occupied — and, thus, homesteaded — unowned scarce resources.

By focusing on creation and labor, rather than on first occupancy of scarce resources, as the touchstone of property rights, IP advocates are led to place undue stress on the importance of “rewarding” the labor of the creator, much as Adam Smith’s flawed labor theory of value led to Marx’s even more deeply flawed communist views on exploitation. As noted above, for Rand, IP rights are, in a sense, the reward for productive work, i.e., *labor*. Rand and other natural-rights IP proponents seem to adopt a mixed natural rights – utilitarian rationale in holding that the person who invests time and effort must be rewarded or benefit from this effort (e.g., Rand opposed perpetual patent and copyright on the grounds that because distant descendants did not create their ancestors’ works, they deserve no reward) (See also [38], pp. 388–89).
In addition, in a strange admixture of natural-rights and utilitarian thinking, the natural-rights IP approach implies that something is property if it can hold value. But as Hoppe has trenchantly shown, one cannot have a property right in the value of one’s property, but only in its physical integrity ([93] pp. 139–41, 237 n. 17). Moreover, many arbitrarily defined “things” can acquire economic value if government grants a monopoly over the thing’s use, even if the thing is not otherwise a scarce resource (e.g., the Postal Service’s monopoly power to deliver first-class letters).

Thus, because ideas are not scarce resources in the sense that physical conflict over their use is possible, they are not the proper subject of property rights designed to avoid such conflicts.

Two Types of Homesteading

What, though, is really wrong with recognizing “new” property rights? After all, since new ideas, artistic creations, and innovations continually enrich us, what is the harm in moving with the times by recognizing new forms of property? The problem is that if property rights are recognized in non-scarce resources, this necessarily means that property rights in material resources are correspondingly diminished. This is because the only way to recognize ideal rights, in our real, scarce world, is to allocate rights in material goods. For me to have an effective patent right – a right in an idea or pattern, not in a scarce resource – means that I have some control over everyone else’s scarce resources.

In fact, we can see that IP rights imply a new rule for acquiring rights in scarce resources, which undercuts the libertarian homesteading principle. For, according to Lockean-libertarian homesteading, it is the first occupier of a previously unowned scarce resource who homesteads it, i.e., becomes its owner. A late-comer who seizes control of all or part of such owned property is simply a thief, because the property is already owned. The thief effectively proposes a new and arbitrary homesteading rule to replace the first-occupier rule, namely, the particularistic rule “I become the owner of property when I forcibly take it from you.” Of course, such a rule is no rule at all, and is clearly inferior to the first-possessor rule. The thief’s rule is particular, not universal; it is not just, and it certainly is not designed to avoid conflicts.

Proponents of IP must also advocate a new homesteading rule to supplement, if not replace, the first-possessor homesteading rule. They must maintain that there is a second way for an individual to come to own material property. To wit, the IP advocate must propose some homesteading rule along the following lines: “A person who comes up with some useful or creative idea which can guide or direct an actor in the use of his own material property thereby instantly gains a right to control all other material property in the world, with respect to that property’s similar use.” This new-fangled homesteading technique is so powerful that it gives the creator rights in third parties’ already owned material property.

For example, by inventing a new technique for digging a well, the inventor can prevent all others in the world from digging wells in this manner, even on their own
property. To take another example, imagine the time when men lived in caves. One bright guy – let us call him Galt-Magnon – decides to build a log cabin on an open field, near his crops. To be sure, this is a good idea, and others notice it. They naturally imitate Galt-Magnon, and they start building their own cabins. But the first man to invent a house, according to IP advocates, would have a right to prevent others from building houses on their own land, with their own logs, or to charge them a fee if they do build houses. It is plain that the innovator in these examples becomes a partial owner of the material property (e.g., land and logs) of others, due not to first occupation and use of that property (for it is already owned), but due to his coming up with an idea. Clearly, this rule flies in the face of the first-user homesteading rule, arbitrarily and groundlessly overriding the very homesteading rule that is at the foundation of all property rights.

There is, in fact, no reason why merely innovating gives the innovator partial ownership of property that others already own. Just because a rule can be proposed does not mean that it is workable or just. There are many arbitrary rules one could dream up by which property rights could be allocated. For example, a racist could propose that any white person can homestead any property already first homesteaded by a black person. Or, the third occupier of a scarce resource becomes its owner. Or, the state can homestead all capital goods, even if already first acquired by individuals. Or, by legislative decree, the state can homestead, in the form of taxes, part of the estates that are already owned by private individuals. All such arbitrary homesteading rules, including the IP rule that innovators homestead partial control of all others’ material resources, are unjustifiable. They all conflict with the only justifiable homesteading rule, first occupation. None of them establish fair, objective rules that avoid interpersonal conflict over scarce resources. Discussions of protecting rights in “ideas,” “creations,” or “things of value” only serve to obscure the fact that the proponent of IP opposes the unadulterated right to homestead and own private property.

**IP as Contract**

**The Limits of Contract**

The law, then, should protect individual rights to one’s body, and to legitimately acquired scarce resources (property). There is not a natural right to ideal objects – to one’s intellectual innovations or creations – but only to scarce resources. Many opponents of IP rights typically support only contractual arrangements to protect ideas and innovations – private contracts between property owners. Suppose, for example, that $A$ writes a book and sells physical copies of it to numerous purchasers $B_1, B_2 \ldots B_N$, with a contractual condition that each buyer $B$ is obligated not to make or sell a copy of the text. Under all theories of contract, any of the buyers $B$ becomes liable to $A$, at least for damages, if he violates these provisions.

But the advocates of the contractual approach to IP are mistaken if they believe that private contract can be used to recreate the same type of protection afforded by
modern IP rights. Patent and copyright are good against all third parties, regardless of their consent to a contract. They are real rights that bind everyone, in the same way that my title to a parcel of land binds everyone to respect my property – even if they do not have a contract with me. A contract, by contrast, binds only parties to the contract. It is like private law between the parties.\textsuperscript{51} It does not bind third parties, i.e., those not in “privity” with the original parties.\textsuperscript{52}

Thus, if the book purchaser $B$ relates to third parties $T$ the plot of the purchased novel, these third parties $T$ are not bound, in general, by the original contractual obligation between $A$ and $B$. If I learn how to adjust my car’s carburetor to double its efficiency, or if I learn of a poem or movie plot someone else has written, why should I have to pretend that I am ignorant of these things, and refrain from acting on this knowledge? I have not obligated myself by contract to the creator. I do not deny that contractual obligations can be implicit or tacit, but there is not even an implicit contract in such situations.

Nor can it be said as a general matter that I have stolen or fraudulently acquired the information, as there are many legitimate ways for individuals to acquire information. Artistic works, by their very nature, typically are made public. Scientific discoveries and innovations likewise can become known beyond the parties to confidentiality agreements. And it certainly cannot be said that my use of my carburetor, or writing a novel using the same plot, physically interferes with the creator’s use of his own material property. It does not even prevent the creator from using his own carburetor idea to improve his own car or others’, or from using that plot.

So, my adjusting my carburetor is not a breach of contract; it is not theft; and it is not physical trespass on the inventor’s material property. Twiddling my carburetor does not violate the inventor’s rights. At most, my use of this idea will diminish its value to the inventor by hampering his ability to monopolistically exploit it. As we have seen, however, one cannot have a right to the value of one’s property, but only in its physical integrity ([93], pp. 139–41, 237 n. 17).

Thus, the use of contract only gets us so far. A book publisher may be able to contractually obligate his purchasers to not copy his book, but he cannot prevent third parties from publishing and selling it, unless some contract prohibits this action.

**Contract Versus Reserved Rights**

Third parties, then, who are not parties to the contract and are not in privity with the contractual obligor and obligee, are not bound by the contractual relationship. For this reason, although an innovator can use contract to stop specified individuals from freely using his ideas, it is difficult to use standard contract law to prevent third parties from using ideas they glean from others. Perhaps sensing this problem, some quasi-IP advocates shift from a purely contractual approach to a “reservation-of-rights” approach in which property rights in material resources are seen as a divisible bundle of rights.
For example, under the standard bundle-of-rights view, a landowner can sell the
mineral estate to an oil company while retaining all rights to the surface, except for
an easement (servitude) granting passage to a neighbor and a life estate (usufruct)
granting use of the surface estate to his mother. Drawing on the bundle-of-rights
notion, the “reservation-of-rights” approach holds that a type of “private” IP can be
privately generated by creatively “reserving rights” to reproduce material items
sold to purchasers.

Rothbard, for example, argues that one can grant conditional “ownership” (of
“knowledge”) to another, while “retaining the ownership power to disseminate the
knowledge of the invention.” Or, Brown, the inventor of an improved mousetrap,
can stamp it “copyright” and thereby sell the right to each mousetrap except for
the right to reproduce it. Like the real rights accompanying statutory IP, such “reser-
vations” allegedly bind everyone, not just those who have contracted with the
original seller. Thus, third parties who become aware of, purchase, or otherwise
come into possession of the restricted item also cannot reproduce it – not because
they have entered into a contract with Brown, but because “no one can acquire a
greater property title in something that has already been given away or sold.” In
other words, the third party acquires a material thing – a book or a mousetrap, say –
but it is somehow “missing” the “right-to-copy” part of the bundle of rights that
“normally” constitutes all rights to the thing. Or, the third party acquires “own-
ership” of information, from a person who did not own the information and, thus, was
not entitled to transmit it to others ([11], p. 123).

But surely something is amiss here. Suppose that A writes a novel and sells a first
copy, BOOK1, without restriction (i.e., without a reservation of rights) to B1; and
a second copy, BOOK2, to B2 – but “reserving” the book’s inherent “right to copy.”
The two books, BOOK1 and BOOK2, appear to third parties to be otherwise
identical. Yet they are not: One is incomplete; the other somehow contains more
mystical “rights-essence” within its covers. Suppose B1 and B2 leave these books on
a park bench, where they are discovered by third party T. According to Rothbard,
BOOK2 is “missing” the “right to copy,” much like an electronic toy that is sold
“batteries not included.” It is as if there is an invisible, mystical tendril of “repro-
duction-ownership” stretching from BOOK2 back to its true owner A, wherever he
may be. Thus, even if T finds and homesteads the abandoned BOOK2, this book
simply does not contain “within itself” the right to permit the owner to copy it. It is
being continually siphoned away by a rights wormhole which connects the item to
owner A. Thus, if T homesteads the book, he still homesteads no more than he
acquires. T homesteads only a book without a right to copy “built in,” and, thus,
does not have the right to copy BOOK2. The same is true for subsequent third
parties who come to possess the book.

Is such a view really tenable? Can we conceive of property rights working this
way? Even if we can, would it really achieve the desired result here – preventing
third parties from using the protected ideas? It is difficult to maintain that rights can
be reserved in this manner. One function of property rights, after all, is to prevent
conflict and to put third parties on notice as to the property’s boundaries. The
borders of property must necessarily be objective and intersubjectively
ascertainable; they must be visible. Only if borders are visible can they be respected and property rights serve their function of permitting conflict-avoidance. Only if these borders are both visible and objectively just (justifiable in discourse) can they be expected to be adopted and followed. But think of the two books, BOOK1 and BOOK2. How could one tell the difference between them? How could one see the rights-tendril connected to the latter but not to the former? How can third parties be expected to respect an amorphous, invisible, mystical, spooky, possibly unknown and unknowable property border?

The implications of such a view are troubling. Palmer Writes:

The separation and retention of the right to copy from the bundle of rights that we call property is problematic. Could one reserve the right, for example, to remember something? Suppose that I wrote a book and offered it to you to read, but I had retained one right: the right to remember it. Would I be justified in taking you to court if I could prove that you had remembered the name of the lead character in the book? ([50], p. 853).53

But third parties still pose a problem for this theory. Even if a seller of an object could somehow “reserve” certain use-rights with respect to the sold object, how does this prevent third parties from using information apparent from or conveyed in that object? Reserved rights proponents say more than that the immediate buyer B1 is bound not to reproduce the book; for this result could be obtained by pointing to the implicit contract between seller A and buyer B1. Let us consider a third party, T1, who finds and reads the abandoned book, thus learning the information in it. Alternatively, consider third party T2, who never has possession of or even sees the book; he merely learns of the information in the book from gossip, graffiti, unsolicited e-mail, and so forth. Neither T1 nor T2 has a contract with A, but both now possess certain knowledge. Even if the book somehow does not contain within it a “right to reproduce,” how can this prevent T1 and T2 from using their own knowledge? And even if we say that T1 is somehow “bound” by a contractual copyright notice printed on the book (an untenable view of contract), how is T2 bound by any contract or reserved right?

Rothbard attempts to address this point as follows:

A common objection runs as follows: all right, it would be criminal for Green [the buyer] to produce and sell the Brown mousetrap; but suppose that someone else, Black, who had not made a contract with Brown, happens to see Green’s mousetrap and then goes ahead and produces and sells the replica? Why should he be prosecuted? The answer is that . . . no one can acquire a greater property title in something than has already been given away or sold. Green did not own the total property right in his mousetrap, in accordance with his contract with Brown – but only all rights except to sell . . . a replica. But therefore Black’s title in the mousetrap, the ownership of the ideas in Black’s head, can be no greater than Green’s, and therefore he too would be a violator of Brown’s property even though he himself had not made the actual contract ([11], p. 123).

There are several problems with this reasoning. First of all, Black merely sees Green’s mousetrap. He does not see or have access to ideas in Green’s head. Nor does he need to have such access in order to duplicate evident features of the mousetrap.

Further, ideas in one’s head are not “owned” any more than labor is owned. Only scarce resources are owned. By losing sight of scarcity as a necessary aspect of
a homesteadable thing, and of the first occupancy homesteading rule as the way to own such things, Rothbard and others are sidetracked into the mistaken notion that ideas and labor can be owned. If we recognize that ideas cannot be owned (they are not scarce resources), that creation is neither necessary nor sufficient for ownership (first occupancy is), and that labor need not be “owned” in order to be a homesteader, then the trouble caused by these confused notions disappears.

If Black somehow comes into possession of the ideas implicit in an item which Brown invented (in Rothbard’s example, he “happens to see” it), it is irrelevant that the mousetrap may not have had a “right to copy” built into it. For Black does not need such permission to use his own property as he sees fit. How does “happening to see” the mousetrap make Black a trespasser or violator of Brown’s rights?

All actions, including action which employs owned scarce means (property), involve the use of technical knowledge [114–116]. Some of this knowledge may be gained from things we see, including the property of others. We do not have to have a “right to copy” as part of a bundle of rights to have a right to impose a known pattern or form on an object we own. Rather, we have a right to do anything at all with and on our own property, provided only that we do not invade others’ property borders. We must not lose sight of this crucial libertarian point. If I own a 100-acres of land, I can prance around naked on it, not because the land is imbued with some “right-to-prance-naked,” but because I own the land and it does not (necessarily) violate the property rights of others for me to use my property in this fashion.

Similarly, I am entitled to do what I want with my own property – my car, my paper, my word processor – including improving my car’s carburetor or using my ink to print words on my paper. That is, unless I have contractually obligated myself to someone else to restrict my actions with respect to my use of this knowledge. I do not have to first find in my property a right-to-use-in-a-certain-way, for all ways of using it, except those that cause invasions of others’ property borders, are already encompassed within the general right to use my property. In libertarianism, we live by right, not permission. We do not need to find permission to take actions with our own property. Contrary to practice in totalitarian societies, all things that are not forbidden are permitted. The reservation-of-rights view would reverse this by assuming that every use of property is valid only if that particular use-right can be somehow found or located in the property.

Consider the following analogy. Farmer Jed discovers oil under his land. No one for miles around knows about the black gold. Jed plans to buy his neighbors’ property for a song; they will sell it cheap, too, since they do not know about the oil. In the middle of the night, his nosy neighbor Cooter, suspicious over Jed’s recent good spirits, sneaks onto Jed’s land and discovers the truth. The next morning, at Floyd’s barbershop, Cooter spills his guts to Clem and the boys. One of them promptly runs to a pay phone and gives a tip to a reporter at the Wall Street Journal (who happens to be his nephew). Soon, it is common knowledge that there is oil in the vicinity. The neighbors now demand exorbitant prices for their land, thus spoiling Jed’s plans.

Let us grant that Cooter can be prosecuted for trespass and harms flowing therefrom. The question is, can Jed’s neighbors be prevented from acting on their knowledge? That is, may they be forced to somehow pretend that they do not know
about the oil, and sell their land to Jed for what they “would have” sold it when in ignorance? Of course they may not be forced so. They own their land, and are entitled to use it as they see fit. Unlike material property, information is not ownable; it is not property. The possessor of a stolen watch may have to return it, but so long as the acquirer of knowledge does not obtain that knowledge illicitly or in violation of a contract, he is free to act upon it.

Note, however, that according to the reservation-of-rights view, the neighbors would not be permitted to act upon their knowledge because they obtained it ultimately from Cooter, a trespasser who had no “title” to that knowledge. Thus, they could not have obtained “greater title” to it than Cooter himself had. Note also that others, such as geological surveyors mapping oil deposits, cannot include this information in their maps. They must feign ignorance until given permission by Jed. This imposed ignorance correlates with the unnatural scarcity imposed by IP. There is clearly no warrant for the view that reserved rights can somehow prohibit third parties from using knowledge they acquire.

It is simply not legitimate to restrict the use to which an owner of property can put it unless that owner has contractually obligated himself or has otherwise acquired the information by a violation of the information-holder’s rights. Talk of reserving the right to copy is merely a way to avoid the contractual notion that only parties to a contract are bound by it.54

Therefore, as a general matter, purchasers can be bound by contracts with sellers to not copy or even resell the thing. However, once third parties become aware of the ideas underlying the invention or literary work, their use of that knowledge does not, in general, violate any recognizable property rights of the seller.

Given this view of scarcity, property, and contract, let us examine the legitimacy of common forms of IP.

**Copyright and Patent**

As should be apparent, copyright and patent seek to prevent the owners of material property – scarce resources – from using their own property as they see fit. For example, they are prohibited, under patent law, from practicing patented methods, using their own property, or from shaping their own property into patented devices, even if they independently invent the method or device. Under copyright law, third parties who have not contracted with the author are prevented from copying or profiting from the author’s original work. Clearly, sellers of novel devices or literary works can contract with buyers to prevent these buyers from reproducing, or even reselling, the item. These contractual webs can be elaborate; a novel writer can license his story to a movie studio on the condition that the studio require all movie theaters to require customers to agree not to reproduce the plot of the movie, and so on.

Yet, once third parties not bound by a contract acquire this information, they are free to use it as they see fit. The reserved rights approach does not change this. Thus, it would probably be difficult to maintain anything similar to our present patent and copyright laws using contract alone.
Trade Secrets

Trade secrets are easier to justify than patent or copyright. Palmer argues that they “emerge” from common law-type rights, and are, thus, legitimate ([50] pp. 854–55; [61], pp. 280, 292–93). Trade secret law allows damages to be obtained for, or an injunction to be issued to prevent, acts of “misappropriation” of a trade secret. This can be applied against the person who has improperly acquired the trade secret or who divulges the secret contrary to a contractual obligation, and also against others who know that they are obtaining the secret from such a person.55

Suppose employee A of company X has access to X’s trade secrets, such as its secret formula for a soft drink. He is subject to an employment agreement obligating him to keep this formula secret. He then jumps to X’s competitor, Y. Y wants to use the formula it learns from A to compete with X. Under current law, so long as the secret formula has not been made public, X can get a court order to stop A from revealing the secret to Y. If A has already revealed the secret to Y, X can also get an injunction to stop Y from using or publicizing the formula.

Clearly, the injunction and damages against A are proper because A is in violation of his contract with X. Because Y had no contract with X. In the context in which such situations usually arise, however, where the competitor Y wants the trade secret and knows the defecting employee is in breach of contract, it could be argued that the competitor Y is acting in conspiracy with or as an accomplice of employee A to violate the (contractual) rights of trade secret holder X. This is because A has not actually breached his trade secrecy agreement until he reveals trade secrets to Y. If Y actively solicits A to do this, then Y is an accomplice or co-conspirator in the violation of X’s rights. Thus, just as the driver of the getaway car in a bank robbery, or the mafia boss who orders an assassination, are properly held liable for acts of aggression committed by others with whom they conspire, third parties can, in narrowly defined cases, be prevented from using a trade secret obtained from the trade secret thief.56

Trademarks

Palmer also argues that trademark law is legitimate ([61], p. 280). Suppose some Lachmannian changes the name on his failing hamburger chain from Lachmann Burgers to Rothbard Burgers, which is already the name of another hamburger chain. I, as a consumer, am hungry for a Rothbard Burger. I see one of the fake Rothbard Burger joints run by the stealthy Lachmannian, and I buy a burger. Under current law, Rothbard, the “owner” of the Rothbard Burgers trademark, can prevent the Lachmannian from using the mark Rothbard Burgers to sell burgers because it is “confusingly similar” to his own trademark. That is, it is likely to mislead consumers as to the true source of the goods purchased. The law, then, gives a right to the trademark holder against the trademark infringer.
In my view, it is the consumers whose rights are violated, not the trademark holder’s. In the foregoing example, I (the consumer) thought I was buying a Rothbard Burger, but instead got a crummy Lachmann Burger with its weird kaleidoscopic sauce. I should have a right to sue the Lachmannian for fraud and breach of contract (not to mention intentional infliction of emotional distress and misrepresentation of praxeological truths). However, it is difficult to see how this act of fraud, perpetrated by the Lachmannian on me, violates Rothbard’s rights. The Lachmannian’s actions do not physically invade Rothbard’s property. He does not even convince others to do this; at most, he may be said to convince third parties to take an action within their rights, namely, to buy a burger from the Lachmannian instead of Rothbard. Thus, it would appear that, under libertarianism, trademark law should give consumers, not trademark users, the right to sue trademark pirates.

Moreover, more novel extensions of trademark, such as rights against trademark dilution or against certain forms of cybersquatting, cannot be justified. Just as a trademark holder does not have a right to his mark, neither does he have a right against his mark’s dilution. The law against cybersquatting is simply based on an economically ignorant opposition to “scalping” and arbitrage. There is, of course, nothing wrong with being the first to acquire a domain name and thereafter selling it to the highest bidder.

### Conclusion

We see, then, that a system of property rights in “ideal objects” necessarily requires violation of other individual property rights, for example, to use one’s own material property as one sees fit (See [50], pp. 831, 862, 864–65; [61], p. 281). Such a system requires a new homesteading rule which subverts the first-occupier rule. IP, at least in the form of patent and copyright, cannot be justified.

It is not surprising that IP attorneys, artists, and inventors often seem to take for granted the legitimacy of IP. However, those more concerned with liberty, truth, and rights should not take for granted the institutionalized use of force used to enforce IP rights. Instead, we should reassert the primacy of individual rights over our bodies and homesteaded scarce resources.

### Notes

1. Terms like “realty,” “personality,” and “tangible” are common-law terms; analogous civil-law terms are “immovables,” “movables,” and “corporeals,” respectively. See [1] for further differences between civil-law and common-law terminology. The term “things” is a broad civil-law concept that refers to all types of items, whether corporeal or incorporeal, movable or immovable. A note about terminology: as argued by Hardy Bouillon [2], it is more precise
to focus on the differences between material and nonmaterial goods rather than between tangible and non-tangible goods, as the touchstone of things subject to property rights. For more on the distinction, see [3].

2. Debate over this issue manifests itself in differences over the issue of inalienability and with respect to the law of contract, i.e., can we “sell” or alienate our bodies in the same manner that we can alienate title to homesteaded property? For arguments against body inalienability, see [4, 5]. For arguments favoring such alienability, see [6]. For further discussion of self-ownership, see [7].

3. For views in opposition to blackmail laws, see [8, 9]; [10], pp. 53–54; [11], pp. 124–126; [12]. For libertarian views in favor of blackmail laws, see [13, 14]. For libertarian arguments against defamation (libel and slander) laws, see [10], pp. 50–53; and [11], pp. 126–128; [15].

4. In some European countries, the term “industrial property” is used instead of “intellectual property.”

6. As one commentator has noted, “intellectual property may be defined as embracing rights to novel ideas as contained in tangible products of cognitive effort.” See [16, 17].

7. A useful introduction to IP can be found in Arthur R. Miller and Michael H. Davis [18]; see also [19]. For a good introduction to patent law, see [20]. More in-depth treatises with further information on IP law include Donald S. Chisum [21–25]. Useful information, brochures, and pamphlets are available from the United States Copyright Office, http://lcweb.loc.gov/copyright, and from the Patent and Trademark Office of the Department of Commerce, http://www.uspto.gov. See also [26].

8. Modern copyright law has superseded and largely preempted “common law copyright,” which attached automatically from the moment of a work’s creation, and which essentially conferred only a right of first publication. Goldstein, Copyright, §§ 15.4 et seq.

9. 17 USC § 302. Due to recent legislation, these terms are 20 years longer than under previous law. See HR 2589, the Sonny Bono Copyright Term Extension Act/Fairness in Music Licensing Act of 1998.

10. Suppose A invents and patents a better mousetrap, which has a Nitinol (memory metal) spring for better snapping ability. Now suppose B invents and patents a mousetrap with a Nitinol spring covered with nonstick coating, to improve the ability to remove mouse remains while still providing the Nitinol-driven snapping action. B has to have a mousetrap with a Nitinol spring in order to use his invention, but this would infringe upon A’s patent. Similarly, A cannot add the nonstick coating to his own invention without infringing upon B’s improvement patent. In such situations, the two patentees may cross-license, so that A can practice B’s improvement to the mousetrap, and so B can use his own invention.

11. In re Alappat, 33 F3d 1526, 1544, 31 USPQ2d 1545, 1557 (Fed Cir 1994) (in banc). See also State Street Bank & Trust Co. v Signature Financial Group, 149 F3d 1368 (Fed Cir 1998).

13. See, e.g., HR 354 (introduced 1/19/1999), Collections of Information Antipiracy Act. See also [27].

17. Ayn Rand mistakenly assumes that the first to file has priority (and then she is at pains to defend such a system). See [29], p.133. She also confusingly attacks the strict antitrust scrutiny given to patent holders. However, since patents are government-granted monopolies, it is not unjust to use an antimonopoly law to limit the ability of a patent owner to extend this
monopoly beyond the bounds intended by the patent statute. The problem with antitrust laws is in their application to normal, peaceful business dealings, not to limit real—i.e., government-granted—monopolies. A similar point might be made with regard to Bill Gates, whose fortune has largely been built based on the government-granted monopoly inherent in copyright. Moreover, as Bill Gates is no libertarian, and doubtlessly does not oppose the legitimacy of antitrust laws, one can hardly wring one’s hands in pity over his having to lie in the very bed he helped make. See also [30].

20. See [29, 36, 37]. Other Objectivists (Randians) who support IP include George Reisman [38, 39]; in response to Stephan Kinsella [40], [41–43], in response to Kinsella [40]. It is difficult to find published discussions of Galambos’s idea, apparently because his own theories bizarrely restrict the ability of his supporters to disseminate them. See, e.g., [44]. Scattered references to, and discussions of, Galambos’s theories may be found, however, in David Friedman [45, 46].

21. [47]; [48], part IV, Chap. 13, p. 121. See also [49, 50].

22. [52, 53], Chap. 11. Ejan Mackaay also advocates IP on utilitarian grounds, in [54]. Earlier utilitarian advocates of IP include John Stuart Mill and Jeremy Bentham. See [55, 56].

23. See [50], pp. 820–21; [57].

24. See [11], pp. 123–24; [50]; [58–61]; on Lepage, see [40]; [62–65].

25. [49]. Also strongly opposed to IP was the nineteenth-century Jacksonian editorialist William Leggett. See [50], pp. 818, 828–29. Ludwig von Mises expressed no opinion on the issue, merely drawing the economic implications from the presence or absence of such laws. See [73], Chap. 23, section 6, pp. 661–662.

26. According to Justinian, “Justice is the constant and perpetual wish to render everyone his due. . . . The maxims of law are these: to live honestly, to hurt no one, to give everyone his due.” The Institutes of Justinian: Text, Translation, and Commentary, trans. J.A.C. Thomas (Amsterdam: North-Holland, 1975).

27. On the defects of utilitarianism and interpersonal utility comparisons, see [74, 75]; [76], pp. 81–82, 92, 98, 144, 149–51.

On scientism and empiricism, see [77, 78].

On epistemological dualism, see [78–81].

28. Mises states: “Although it is usual to speak of money as a measure of value and prices, the notion is entirely fallacious. So long as the subjective theory of value is accepted, this question of measurement cannot arise” [82]. Also: “Money is neither a yardstick of value nor of prices. Money does not measure value. Nor are prices measured in money: they are amounts of money” [83]; see also [73], pp. 96, 122, 204, 210, 217, and 289.

29. For an excellent survey and critique of the cost-benefit justification for patent and copyright, see [57]. For useful discussions of evidence in this regard, see [61]; [50], pp. 820–821, 850–851; [63], pp. 812–13; [84, 85].

30. [88], p. 43. See also [58], pp. 658–59:

It is by no means self-evident that patents encourage an increased absolute quantity of research expenditures. But certainly patents distort the type of research expenditure being conducted. . . . Research expenditures are therefore overstimulated in the early stages before anyone has a patent, and they are unduly restricted in the period after the
patent is received. In addition, some inventions are considered patentable, while others are not. The patent system then has the further effect of artificially stimulating research expenditures in the patentable areas, while artificially restricting research in the nonpatentable areas. See also [89].

31. Plant is correct in stating that “[t]he task of distinguishing a scientific discovery from its practical application, which may be patentable . . . is often baffling to the most subtle lawyer.” “The Economic Theory Concerning Patents for Inventions,” pp. 49–50. On a related note, the US Supreme Court has noted that “[t]he specification and claims of a patent . . . constitute one of the most difficult legal instruments to draw with accuracy.” Topliff v Topliff, 145 US 156, 171. 12 S.Ct. 825 (1892). Perhaps this is because patent law has no moorings to objective borders of actual, material property, and thus is inherently vague, amorphous, ambiguous, and subjective. For the latter reason alone, one would think that Objectivists—ardent, self-proclaimed defenders of objectivity and opponents of subjectivism—would oppose patent and copyright.

32. In re Trovato, 33 USPQ2d 1194 (Fed Cir 1994). Recent case law has expanded the types of mathematical and computer algorithms and business methods that can be protected by patent. See, e.g., State Street Bank & Trust Co. v Signature Financial Group, 149 F3d 1368 (Fed Cir 1998). However, no matter where the line is drawn between unpatentable “laws of nature” and “abstract ideas” and patentable “practical applications,” patent law still necessarily makes a distinction between the two.

34. Tuccille, It Usually Begins with Ayn Rand, p. 70. Of course, I suppose that any Galambosian other than Galambos himself, having the same type of dilemma, would be unable to change his name as a solution to the problem, because this solution was Galambos’s inalienable, “absolute” idea.

35. The fundamental economic, or catallactic, role for private property rights, along with money prices arising from exchanges of property, is to permit economic calculation. See Stephan Kinsella, “Knowledge, Calculation, Conflict, and Law: Review Essay of Randy E. Barnett [92].

36. [88], pp. 35–36; [94]; [61], pp. 261–66 and n. 50 (distinguishing between “static” and “dynamic” scarcity), also pp. 279–80; [50], pp. 860–61, 864–65; and [95]; on Tucker, see [60].

37. [93], pp. 140–41.

38. See, on the proper approach to homesteading and the first-user rule (the prior-later distinction), [93], pp. 141–44; [96, 97]. “Once the item is owned by the first-user, others no longer have the option of being its first-user; thus, their preferences at that point in time have no bearing on the Pareto-superior nature of the acquisition by the first-user”; and [76], pp. 172–79. On the ethical justifications of such a property rights scheme, see [93], Chap. 7; [11, 95, 96–99].

Rand, “Patents and Copyrights,” p. 131. Mises, in Human Action, p. 661, recognizes that there is no need to economize in the employment of “formulas,” “because their serviceableness cannot be exhausted.” On p. 128, he points out:

A thing rendering such unlimited services is, for instance, the knowledge of the causal relation implied. The formula, the recipe that teaches us how to prepare coffee, provided it is known, renders unlimited services. It does not lose anything from its capacity to produce however often it is used; its productive power is inexhaustible; it is therefore not an economic good. Acting man is never faced with a situation in which he must choose between the use-value of a known formula and any other useful thing.

See also p. 364.

Plant, “The Economic Theory Concerning Patents for Inventions,” p. 36. Also Mises, Human Action, p. 364: “Such recipes are, as a rule, free goods as their ability to produce definite effects is unlimited. They can become economic goods only if they are monopolized and their use is restricted. Any price paid for the services rendered by a recipe is always a monopoly price. It is immaterial whether the restriction of a recipe’s use is made possible by institutional conditions—such as patents and copyright laws—or by the fact that a formula is kept secret and other people fail to guess it.” See also [3].

It could also be argued that ideal objects deserve legal protection as property because they are “public goods,” i.e., because of negative externalities which arise if IP is not legally protected. However, the concept of public goods is neither coherent nor justifiable. See [61], pp. 279–80, 283–87; [100]; [96], Chap. 1. As Palmer points out:

the cost of producing any service or good includes not only labor, capital marketing, and other cost components, but also fencing (or exclusion) costs as well. Movie theaters, for example, invest in exclusion devices like ticket windows, walls, and ushers, all designed to exclude non-contributors from enjoyment of service. Alternatively, of course, movie owners could set up projectors and screens in public parks and then attempt to prevent passers-by from watching, or they could ask government to force all non-contributors to wear special glasses which prevent them from enjoying the movie. ‘Drive-ins,’ faced with the prospect of free riders peering over the walls, installed—at considerable expense—individual speakers for each car, thus rendering the publicly available visual part of the movie of little interest. . . . The costs of exclusion are involved in the production of virtually every good imaginable. There is no compelling justification for singling out some goods and insisting that the state underwrite their production costs through some sort of state-sanctioned collective action, simply because of a decision to make the good available on a nonexclusive basis.

Palmer [61], pp. 284–285. There is no way to show that ideas are clearly public goods. Moreover, even if ideas were public goods, this does not justify treating them as property rights, for the same reasons that even wealth-increasing measures are not necessarily justified, as discussed above.

Occupancy or taking possession “can take three forms: (1) by directly grasping it physically, (2) by forming it, and (3) by merely marking it as ours.” Palmer [50], p. 838.

I also do not need to rely on “ownership” of my labor; strictly speaking, labor cannot be owned, and labor ownership need not be relied on to show that I maintain ownership of my property as I transform it. See also [101].

Even such advocates of IP as Rand do not maintain that creation per se is sufficient to give rise to rights, or that creation is even necessary. It is not necessary because unowned property can be homesteaded by simply occupying it, which involves no “creation” unless one stretches the concept without limit. It is also not sufficient, because Rand would certainly not hold that creating an item using raw material owned by others gives the thief-creator ownership of the
Rand’s view even implies that rights, including property rights, only arise when there is a possibility of conflict. Rand, for example, views rights as a social concept arising only when there is more than one person. See [104], p. 321: “A ‘right’ is a moral principle defining and sanctioning a man’s freedom of action in a social context.” Indeed, as Rand argues, “Man’s rights can be violated only by the use of physical force,” i.e., some conflict over a scarce resource. “The Nature of Government,” in Capitalism: The Unknown Ideal, p. 330. On p. 334, Rand attempts (unsuccessfully) to justify government, the agent that enforces rights, based on the fact that there can be “honest disagreements”—i.e., conflict—even among “fully rational and faultlessly moral” men. So, in Rand’s theory, creation per se is neither necessary nor sufficient, just as in the theory of property advocated herein. See also [103].

It is for these reasons that I disagree with the creation-centered approach of Objectivists David Kelley and Murray Franck. According to Franck, “Intellectual and Personality Property,” p. 7, “although property rights help ‘ration’ scarcity, scarcity is not the basis of property rights. The view that it is . . . appears to reverse cause and effect in that it sees rights as a function of society’s needs rather than as inherent in the individual who in turn must live in society.” See also [101].

Even otherwise sound thinkers sometimes place undue stress on the importance of labor to the homesteading process and its ability to be “owned.” Rothbard himself, for instance, implies that an individual “owns his own person and therefore his own labor.” Rothbard [95], p. 284, emphasis added; see also Rothbard, The Ethics of Liberty, p. 49. It is a misleading metaphor to speak of “owning one’s labor” (or one’s life or ideas). The right to use or profit from one’s labor is only a consequence of being in control of one’s body, just as the right to “free speech” is only a consequence, or a derivative, of the right to private property, as Rothbard recognized in The Ethics of Liberty, esp. [11], Chap. 15. See also [101].

See, e.g., [105]: “It was, indeed, Adam Smith who was almost solely responsible for the injection into economics of the labour theory of value. And hence it was Smith who may plausibly be held responsible for the emergence and the momentous consequences of Marx.” Even otherwise sound thinkers sometimes place undue stress on the importance of labor to the homesteading process and its ability to be “owned.” Rothbard himself, for instance, implies that an individual “owns his own person and therefore his own labor.” Rothbard [95], p. 284, emphasis added; see also Rothbard, The Ethics of Liberty, p. 49. It is a misleading metaphor to speak of “owning one’s labor” (or one’s life or ideas). The right to use or profit from one’s labor is only a consequence of being in control of one’s body, just as the right to “free speech” is only a consequence, or a derivative, of the right to private property, as Rothbard recognized in The Ethics of Liberty, esp. [11], Chap. 15. See also [101].

See [50], pp. 821 n. 8, 851–55, 864; [60]; [61], pp. 280, 291–295; [63], pp. 804–805; [106, 107].

See, e.g., [11], Chap. 19; [108–110].

Under the international law meta-rule pacta sunt servanda (contracts are to be observed), contracts between sovereigns (states, in the international law context) create a “law of the agreement” between the parties. See [111], Chaps. 2, 5.

For a definition of “privity of contract,” see [112], p. 1199. See also, in the IP context, Bouckaert [63], pp. 795, 805.

Palmer also quotes the following illuminating passages.

Hegel argued:

The substance of an author’s or an inventor’s right cannot in the first instance be found in the supposition that when he dispenses of a single copy of his work, he arbitrarily makes it a condition that the power to produce facsimiles as things, a power which thereupon passes into another’s possession, should not become the property of the other but should remain his own. The first question is whether such a separation between ownership of the thing and the power to produce facsimiles which is given with the thing is compatible with the concept of property, or whether it does not cancel the complete and free ownership on which there originally depends the option of the single producer of intellectual work to reserve to himself the power to reproduce, or to part with this power as a thing of value, or to attach no value to it at all and surrender it together with the single exemplar of his work. (Hegel’s Philosophy of Right, p. 55, quoted in Palmer, “Are Patents and Copyrights Morally Justified?” p. 853 n. 138)

And, as Kant noted:

Those who regard the publication of a book as the exercise of the rights of property in respect of a single copy—it may have come to the possessor as a [manuscript] of the
author, or as a work printed by some prior publisher—and who yet would, by the reservation of certain rights, . . . go on to restrict the exercise of property rights, maintaining the illegality of reproduction—will never attain their end. For the rights of an author regarding his own thoughts remain to him notwithstanding the reprint; and as there cannot be a distinct permission given to the purchaser of a book for, and a limitation of, its use as property, how much less is a mere presumption sufficient for such a weight of obligation? (Immanuel Kant, “Was ist ein Buch?” in Die Metaphysic die Sitten, ed. W. Weischedel [Frankfurt a.M.: Suhrkamp Verlag, 1977], p. 581, translated and quoted in Palmer, “Are Patents and Copyrights Morally Justified?” p. 853 n. 138)

For an alternative translation, see [113].

54. Of course, in anarcho-capitalism, it is difficult to predict what extensive contractual regimes, networks, and institutions will arise. Various enclaves or communities may well require their customers, patrons, or “citizens” to abide by certain IP-like rules. On anarcho-capitalism, see, e.g., [117].

55. UTSA, § 1; Halligan, “Restatement of the Third Law—Unfair Competition: A Brief Summary,” § 40, comment d.

56. On responsibility for conduct of another or for conspiracy, see, e.g., Texas Penal Code, §§ 7.02 (Criminal Responsibility for Conduct of Another), and 15.02 (criminal conspiracy). For definitions of “abet,” “accessory,” “accomplice,” “aid and abet,” “concert,” and “conspiracy,” see Black’s Law Dictionary.
